# EJMTec overview

Remove the headache and drama out of Asset management!

The system is designed for the construction industry to assist the plant division of Construction Companies in their day to day tasks of hiring/selling out equipment to sites and then charge the sites for the use of their equipment.

It also controls the usages of equipment and the servicing costs, which allows you as user to check if certain items are making a profit or a loss and if it's worthwhile holding on to the equipment. You will be able to keep a complete register of all your equipment and know at all times what's currently on site, or on yard and the exact status of your equipment. A history of all transactions of sites, yards and equipment will also be readily available.

## EJMTec is easy to use, with detailed screens for easy input.

All functions within EJMTec are categorised according to its specific function and easily accessible.

Asset Register

The system caters for two types of assets
- **Individual** assets: that will be your large equipment that is individually recognizable with a serial number/registration number etc.
- **Bulk** assets: that will be your bulk equipment like scaffolding, shovels etc. that don't have any serial numbers or isn't individually recognizable.

Individual Product Maintenance.

Issue Items to Site

You can easily issue items to a selected site. The site will be charged for the items from the date of issue, you will also be able to back date your issue. Once the issue is posted, the yard levels and site levels will be automatically adjusted. The system will keep the entire history of an item, from issue to return.

Reports

The system has vast amount of reports. On a monthly basis you will do an invoice run that will generate the invoices for all sites that "hired" equipment from the yard; that is either still on site or were on site during the specified invoice period. This invoice run is fully integrated into our **EJMCount** module.

There are also various management reports to allow you to see currently signed out items to a specific site, or what's the current status of all items in your asset register.
